

ABSTRACT OF THE DISCLOSURE

An object of the present invention is to provide a breast pad which avoids hard feelings caused by thermal deformations and heat treatments. In considering this, the breast pad of the present invention has a main body formed by laminating and fixing together a liquid-absorbing member 12, a waterproof member 11 disposed at an outside of the liquid-absorbing member and a surface member 13 disposed on a surface of the liquid-absorbing member opposite to a surface on which the waterproof member is disposed. The main body further includes elastic members 17, 17 each disposed on a respective side edge portion of the main body, and side edges 13a of the surface members to be disposed at a user's skin side are folded so as to embrace side edges of the liquid-absorbing member therein.
